

ZoomDev
IDEA TO EXIT

Regeneration you can **prove**.

ZoomDev OS turns degraded land into audit-ready biostartups. The proof is generated **with** the asset, not years after it.

REQUIRED SLIDES • STARTUP WORLD CUP APPLICATION

1 • Problem Statement	02	2 • Proposed Solution	03	3 • Product Details	05	4 • Business Model	07	5 • Market Opportunity	08	6 • Competition	12
7 • Growth Strategy	09	8 • Current Traction	06	9 • Financials	10	10 • Team	11	11 • Funding Status	13		

The world is not short of land that could capture carbon. It is short of **proof** that it did.

Who has the problem

Municipalities with climate targets and no instrument.
Agricultural cooperatives sitting on degraded soil.
Corporates that must retire credits and cannot audit what they buy. And the family farmer, who owns the carbon and cannot reach the market.

Why today's answer fails

Certification is retrospective, slow and expensive: a first cycle typically burns 20 to 40 percent of the credit value before a single tonne is sold. The proof is built years after the land changed.

And the tooling is split in two

AI builders ship software with no domain evidence.
Carbon platforms verify assets they did not originate.
Nobody stands between the soil and the registry, and that gap is where the market stalls.

Put plainly: a farmer with 50 hectares of degraded soil cannot enter a market measured in billions, because proving what happened on that land costs more than the land returns.

One operating system that regenerates, originates and proves.

Three moves. Not four.

+30%

LEAF AREA, FROM 30% UPWARD

Documented in signed technical reports. More lamina means more solar capture and more photosynthesis per hectare. [LAB REPORT 98](#)

+2.99 t

CO₂E PER HECTARE PER YEAR

Conservative scenario, computed by our own engine from the biomass gain. Presented as an estimate until instrumented MRV exists. [ESTIMATE](#)

Not 30%

MORE DECARBONIZATION

Photosynthesis does not scale linearly with leaf area, and assimilated carbon is not sequestered carbon. We say what we can defend.

We could claim thirty percent more decarbonization on this slide. Our own protocol forbids it until instrumented MRV and third-party verification are in place. **That rule is not a disclaimer. It is the product.**

Built, deployed and running in production today.

Idea to company

Ideation, classification, a fourteen-section business plan written by five agents with live web research, a navigable MVP with real code, publishable site and DOCX/PDF export.

Impact 360° engine

Food security, just energy transition, carbon and local economy from one input: crop, hectares and soil condition. Every dimension returns its own evidence seal.

Carbon stack

Environmental liability calculator, mitigation-hierarchy offset plan (measure, reduce, compensate) and CarbonPay for settlement by card or instant transfer.

Public funding radar

Daily sweep of public calls with automatic matching against each project, so a biostartup finds non-dilutive capital without a consultant.

98

AUTOMATED TESTS
PASSING

Gamified by design: the founder advances from Seed to Forest, and the same mechanic that keeps them building is what keeps the evidence complete.

Pre-revenue. Here is exactly what is real.

We are not going to dress a projection as a result. Everything on the left is a system fact you can open and inspect. Everything on the right is still to come, and is labelled as such.

SHIPPED AND VERIFIABLE

- ▶ **Platform live in production**, full stack deployed, health-checked, with paid plans and instant-transfer settlement wired in.
- ▶ **Evidence Seal enforced in code**, not in a policy document: the weakest link caps every claim automatically.
- ▶ **Impact 360° engine** producing auditable output for 15 crops across three soil-response scenarios.
- ▶ **27 agents under versioned protocols**, with the boundary between documented result and investigated mechanism written into each one.
- ▶ **98 automated tests** covering session security, evidence rules and the impact engine.
- ▶ **Selected by Programa Centelha 3**, the Brazilian Federal Government's innovation grant run by MCTI with FINEP, CNPq and the state research foundations. Competitive public call, non-dilutive, and third-party validation of the thesis.

TO COMPLETE BEFORE SUBMISSION

- ▶ Named pipeline: municipalities, cooperatives and producers currently in conversation

- ▶ Hectares under letter of intent

- ▶ Registered users and active projects at submission date

- ▶ Other public funding programmes applied to, with status

- ▶ Awards, accelerators or institutional partnerships

CAC, LTV, retention, churn and NPS are not yet measurable at pre-revenue stage. We will publish them the quarter they become real, under the same evidence rules we apply to carbon.

Three revenue lines, one funnel.

Software pays for itself from day one. Carbon is the compounding line: every hectare we help originate keeps paying while the credit lives.

LINE 1 · SUBSCRIPTION

Free	R\$ 0	500 credits
PRO	R\$ 149	3.000 credits
BUSINESS	R\$ 199	6.000 credits

Per month. Live prices, already charging.

LINE 2 · CREDIT PACKS

500	R\$ 39	one full plan
1.500	R\$ 99	plan + MVP
5.000	R\$ 279	portfolio

Top-ups. No expiry, no subscription required.

LINE 3 · CARBONPAY

12% / 8%

12 percent take on each verified transaction, 8 percent on origination when we bring the project to the registry. Paid only on tonnes that actually clear verification.

UNIT ECONOMICS · WHAT THE PRICE BUYS

Full business plan, 14 sections + live research	180 credits
Navigable MVP with real code	120 credits
PRO subscriber at full monthly usage	16 plans

COST STRUCTURE AGAINST PRICE

Inference is the only variable cost that scales with usage. Modelled at R\$ 0,02 per credit, a fully consumed PRO seat costs R\$ 60 against R\$ 149 of revenue: **60 percent gross margin in the worst case**, higher at typical usage, since most seats never spend their whole allowance. **ASSUMPTION**

Metered per-call cost accounting ships with the first paid cohort, and replaces this assumption with measurement.

Two independent counts. Both clear one billion dollars.

TOP-DOWN • TAM

Voluntary carbon market, 2025	US\$ 15,8 bn
Same market, 2030 outlook	US\$ 7 – 120 bn
Low-code AI app platforms, 2025	US\$ 33,7 bn
Brazil regulated market (SBCE)	from 2024 law

Sources: Mordor Intelligence (US\$ 15,8 bn in 2025, US\$ 120 bn by 2030 at 50% CAGR); MSCI Carbon Markets, the conservative counterweight (US\$ 7 – 35 bn by 2030); SkyQuest, low-code platforms; Brazilian Federal Law 15.042/2024, which created the SBCE emissions trading system.

RESEARCH 75

BOTTOMS-UP • SAM, BRAZIL ONLY

Degraded pasture with conversion potential	28 M ha
Our engine, conservative scenario	2,99 tCO ₂ e/ha/yr
Annual mitigation potential	83,8 Mt CO ₂ e
Gross market value at US\$ 20/t	US\$ 1,68 bn / yr

Hectares from Embrapa, published in *Land*: 10,5 M ha severely and 17,5 M ha moderately degraded, with good or very good conversion potential. Brazil holds up to 109,7 M ha of pasture with some level of degradation, so 28 M is the conservative floor, not the ceiling.

RESEARCH 75

At our 12 percent take rate, the Brazilian bottoms-up figure alone is a **US\$ 201 million annual revenue pool**, before a single subscription is counted and before we leave the country.

Land one territory. Then multiply inside it.

A municipality is not one customer. It is a hundred biostartups waiting for an instrument, and each one carries the next.

Aligned by construction with the UN Sustainable Development Goals, the UN Global Compact and a just energy transition: the community that regenerates the land owns the energy it produces.

Five years, built from the bottom up.

Every line comes from a price that already exists in the product and a conversion assumption printed next to it.
Nothing is reverse-engineered from a target.

YEAR	PAYING SEATS	SUBSCRIPTION	CARBONPAY GMV	TAKE AT 12%	TOTAL REVENUE	US\$ AT 5,40
2026	300	R\$ 0,6 M	R\$ 0	R\$ 0	R\$ 0,6 M	US\$ 0,1 M
2027	1.500	R\$ 2,9 M	R\$ 8 M	R\$ 1,0 M	R\$ 3,9 M	US\$ 0,7 M
2028	5.000	R\$ 9,6 M	R\$ 40 M	R\$ 4,8 M	R\$ 14,4 M	US\$ 2,7 M
2029	12.000	R\$ 23,0 M	R\$ 120 M	R\$ 14,4 M	R\$ 37,4 M	US\$ 6,9 M
2030	25.000	R\$ 48,0 M	R\$ 300 M	R\$ 36,0 M	R\$ 84,0 M	US\$ 15,6 M

ASSUMPTION · SEATS

Blended R\$ 160 per seat per month across PRO and BUSINESS, net of the free tier.

ASSUMPTION · CARBON

GMV starts only in 2027, after the first cohort clears third-party verification. Nothing is booked before a tonne is retired.

ASSUMPTION · SCALE CHECK

2030 GMV of R\$ 300 M is 2,8 Mt CO₂e at R\$ 110 a tonne: 3,3 percent of the 83,8 Mt on slide 08.

Where the numbers come from. Prices and credit costs are live product configuration. Hectare and tonne figures are engine output. Conversion rates are the assumption, and that is the line we expect to be challenged on. PROJECTION

The people behind it.

WHAT THE TEAM ALREADY SHIPPED

A full-stack platform in production with 27 governed agents, an auditable impact engine, payment rails and an evidence-governance layer that no competitor in either category currently offers. That is the execution evidence available today.

Two crowded categories, and nobody in the gap between them.

ALTERNATIVE THE CUSTOMER USES TODAY	BUILDS SOFTWARE	REGENERATES SOIL	GOVERNS EVIDENCE	SETTLES CARBON
BASE44 • LOVABLE • REPLIT • BOLT	yes	no	no	no
VERRA • GOLD STANDARD REGISTRIES	no	no	yes	no
PACHAMA • SYLVERA • BEZERO (MRV, RATINGS)	no	no	yes	no
BRAZILIAN ORIGINATORS AND BROKERS	no	no	partial	yes
AGRI INPUT SUPPLIERS	no	yes	no	no
CONSULTANTS AND SPREADSHEETS (THE REAL INCUMBENT)	no	no	no	no
ZoomDev OS + Coin Max	yes	yes	yes	yes

WHY A CUSTOMER PICKS US OVER THE INCUMBENT

Against a consultant, we are faster and cheaper by an order of magnitude. Against a registry, we arrive before the project exists. Against an AI builder, we carry the domain evidence they cannot fake.

WHAT WOULD ACTUALLY THREATEN US

An MRV platform moving upstream into origination, or an AI builder acquiring a biotech. Our defence is the evidence layer and the field data that only accumulates by being in the soil first.

Where we are, and what the round buys.

STAGE

Non-dilutive to date. No equity round has been raised and no shares have been issued.

RAISED TO DATE

Programa Centelha 3, the Brazilian Federal Government innovation grant (MCTI, FINEP, CNPq and the state research foundations). Won through a competitive public call.

RAISING NOW

Amount sought

— — — — —

RUNWAY

Months the round funds

— — — — —

USE OF FUNDS · 1

Instrumented MRV

Sensors, control plots and accredited third-party verification. This is what turns our estimate into a credit, and it is the single highest-leverage spend in the company.

USE OF FUNDS · 2

Field deployment

Hectares under application with agronomic supervision, in the territories where the response curve is strongest.

USE OF FUNDS · 3

Product and team

Metered cost accounting, registry integration and the engineering to carry the first paying cohort.

USE OF FUNDS · 4

Go to market

Municipal and cooperative contracts, and the public-funding applications the radar already surfaces.

The round has one job above all others: close the distance between **estimate** and **verified credit**. Everything else in this deck already exists.

Generative AI and conscious biotechnology, in symbiosis, so the Amazon can regenerate **faster than it is lost.**

- ▶ Three takeaways.
- ▶ The bottleneck of the carbon market is proof, and we generate proof at origination.
- ▶ Coin Max makes the worst soil the best business, which is exactly where the need is.
- ▶ The platform is built and running. The round buys verification, not a prototype.
